

How to get rid of calcium

Allowing calcium to build up in your kitchen/bathroom is not a pretty sight. Getting rid of calcium can be tricky because if you use harsh chemicals incorrectly, it can look worse. Below is a guide on how to remove calcium safely.

1. The first thing you have to do is, add vinegar and water into a small bowl. Approx. 70% vinegar and 30% water.

The vinegar should not be too acidic. Choose one that is used for food.

2. Dip a small piece of cloth in the bowl, and place it on the surface that needs to be treated. Leave it on for 1 hour.

Wrap the cloth around the faucet if needed, and leave it for 1 hour.

3. After 1 hour, use a soft sponge to get rid of the remaining calcium. Please be careful not to scratch the sink with the sponge

4. A calcium free tap should like this
